

air plant

Air plants have roots but don't need soil. As epiphytes they use their roots to attach to objects in nature and to absorb nutrients and water. Place them on a decorative tray or in a hanging vessel.

Grow Air Plants within a few feet of a window. Direct sun will cause leaf burn and over drying.

Fertilize with half strength all-purpose fertilizer once per month.

No soil needed for these air dwellers!

Well cared for air plants will produce pups or propagules which can be removed and grown separately or left with the parent for a clumping effect.

Rinse or swish air plants in water for several minutes once or twice per week. Gently shake plants to remove excess water. Hang-dry with good air circulation. For longevity, keep blooms dry when watering.
