

anthurium

These striking, tropical plants are almost unreal with flowers so thick and shiny they look like they could have been manufactured rather than created by nature.

Anthurium prefer bright, indirect light. Their thick, waxy leaves can tolerate some direct sunlight.

This Aroid likes a well-drained, all-purpose potting soil with added bark and perlite. Combine 1 part all-purpose potting soil, 1 part orchid bark, 1 part perlite, 1/2 part charcoal, 1/2 part worm castings.

Keep soil evenly moist. Anthuriums do not like to dry out completely.

Feed weekly during periods of active growth; spring and summer.

Anthurium may produce aerial roots that can be misted, pushed into the soil, or cut off at soil level. Not all Anthuriums have a significant flower. These include varieties like superbum, radicans, cobra, and other "rare" varieties. If healthy and happy, Anthurium will bloom any time of the year. Anthurium thrive in high humidity.
