

dracaena

Also known as corn plant, Dracaena have an upright growth habit meaning they don't take up much real estate, making them an excellent addition for any size room. Plus, they are one of the best plants for cleaning and purifying the air.

Place in bright, indirect to medium light.

Fertilize once per month with an all-purpose fertilizer.

Plant in an all-purpose potting soil.

Low humidity can cause browning leaf tips, as can excess salts in the water. Use a humidifier in very dry, indoor winter air conditions, use distilled water with added fertilizer, or let your watering can sit out overnight so excess salts can evaporate.

Allow dracaena to dry down about half-way between watering. Overwatering can cause root rot, fungal and bacterial diseases. Dracaena are sensitive to extra salts in tap water. Consider distilled water with added fertilizer.
