

holiday cactus

These succulent-type plants produce bright, tubular blooms. Each variety will bloom during different times of the year, typically spring, late fall, and holiday time.

Holiday cactus like bright, indirect or filtered light and require short days to bloom. Artificial light breaks the cycle.

Plant in all-purpose potting soil.

Water thoroughly when the top few inches of soil are dry. Keep evenly moist when watering. These plants can tolerate drought after blooms have dropped.

Fertilize at half-strength with an all purpose fertilizer during periods of active growth.

Keep Holiday Cactus near a cool window to encourage blooms. Once bud set has begun, changes in temperature or light can cause bud drop.
