

# leopard lily

Also known as Silver Squill or Scilla, the Leopard Lily has wildly spotted leaves and a free-form spreading habit.

---

Place in bright, indirect light, preferably 8 hours per day. Direct sun can burn leaves and diminish variegation.

Water with 1/4 strength fertilizer monthly during active growth.

Plant in an all-purpose potting soil. Cactus soil also works as this allows for ample drainage and aeration.

Flowers appear in the spring or early summer and look just like a hyacinth bloom.

This plant stores water in its bulbs and can tolerate drought. Water when the soil has been allowed to dry out almost completely.
