

stapelia

Stapelia are a genus of low growing, spine-less succulent plants.

Place in bright light.

Use a cacti specific fertilizer during active growth, spring through summer. Pause fertilization during inactive growth, fall and winter.

Use a sharp, well-drained potting soil such as a Cactus specific mix. Your soil should take up water, but drain and dry quickly.

Stapelia flowers will take you to the "Upside Down" with their distinctive look and smell!

Easy on the water! Water and drain thoroughly, then let soil dry completely between waterings.
